

Snake Cash Rush Summary

Executive Summary

Snake Cash Rush is a browser-based Snake game built under 'games/snake/src' with Python-driven gameplay logic, a money-bill pickup theme, a polished modern interface, live score tracking, and a persisted best score. The game is self-contained, frontend-only, and runs locally through a simple static server.

Delivered Scope

- Classic Snake gameplay with continuous movement and keyboard controls
- Cash-bill pickups that grow the snake and increase score
- Best-score persistence through browser local storage
- Start, live-play, and game-over states with clear overlay messaging
- Modern glass-style HUD and responsive layout
- Detailed getting started guide in 'games/snake/README.md'

Acceptance Criteria Status

1. Page shows title, board, score, best score, and start flow: Verified
2. Snake starts moving and continues automatically after run start: Verified
3. Money-bill pickup grows snake, raises score, and respawns pickup: Verified
4. Best score updates only on exceed and survives reload: Verified
5. Collision ends the run and exposes restart path: Verified
6. Game is implemented inside 'games/snake/src': Verified
7. Interface uses a cohesive modern visual system: Verified
8. Layout remains usable on narrow screens: Verified
9. Getting started guide supports local run without missing steps: Verified

Validation Evidence

- Static diagnostics passed for HTML, CSS, JavaScript, and Python files
- Local app served successfully from 'games/snake'
- Browser validation confirmed start state, live state, collision state, and restart path
- Deterministic validation confirmed score increment from '0' to '10', snake growth from 3 to 4 segments, and best-score persistence across reload
- Narrow-screen validation at '390x844' showed no horizontal overflow

Test Cases Executed

1. Launch local static server and load 'http://127.0.0.1:8000/src/'
2. Verify initial UI elements and ready overlay are visible
3. Start a run and confirm live-play state activates
4. Force a valid pickup on the next step and confirm score, growth, and best-score update
5. Advance until wall collision and confirm game-over state

6. Reload the page and confirm best score persists
7. Resize to a narrow mobile viewport and confirm layout remains usable

Files Changed

- 'games/snake/src/index.html'
- 'games/snake/src/styles.css'
- 'games/snake/src/app.js'
- 'games/snake/src/main.py'
- 'games/snake/README.md'

- 'specs/snake-cash-rush/summary.md'

Remaining Risks

- PyScript depends on network access for its CDN-hosted runtime on first load.
- Two minimal debug hooks remain in the Python runtime to support deterministic browser validation.
- Automated browser input was less reliable than direct DOM-triggered validation under the current harness, although the gameplay logic itself validated successfully.
